

TEST RESULTS:

PRE-RECEPTIVE

Recommendation#: The personalized embryo transfer (pET) of a blastocyst/s should be performed 1 day later than the time at which this endometrial biopsy was performed. A new endometrial biopsy is not required. **

INTERPRETATION OF YOUR RESULT#:

According to our internal data, 89% of women with similar endometrial profile reached receptivity with 1 more day of progesterone administration (confidence interval of 95% [86%-91%]), so in these cases new endometrial biopsy is not needed. Therefore, blastocyst/s transfer is recommended 1 day later than the time at which this endometrial biopsy was performed.

For a day-3 embryo/s, the transfer should be performed two days earlier than indicated in the recommendation for blastocyst transfer above.

** This recommendation is only applicable to the same type of cycle treatment as the one used for this endometrial biopsy and if the endogenous progesterone measured prior to the first progesterone intake is <1ng/ml.
